Ex-president says he was hit by bullet; shooter, rallygoer dead

Butler, Pa. — Donald Trump appeared to be the target of an assassination attempt as he spoke during a rally in Pennsylvania on Saturday, law enforcement officials said.

Trump was hit by a bullet, according to aSecret Service official, who said that Trump was quickly pulled away by Secret Service agents and his campaign aids were "left." A local prosecutor said the suspected gunman and at least one attendee are dead.

"I know immediately that something was wrong in that I heard a whistling sound and I turned around, and the bullet ripped through the skin," he said.

The attack, by a shooter who law enforcement officials say was then killed by the Secret Service, was the first attempt.

The monsoon clouds break up just before the sun sets on Tucson after a recent monsoon storm. It is 7 degrees hotter in the city now than the surrounding desert, a new study says.

As our temperatures hang around 110 degrees much of the past week, a new study finds Tucson is now 7 degrees hotter than it was in 1940s, the effect of built.

As part of that comparison, the study concluded following requests from the newly Funding, Tucson and Phoenix, suffers proportionally less from the urban heat island effect than its neighbors - even though it's much hotter overall in Arizona. A prominent University of Arizona research on extreme heat said, however, that it would not report it.

During extreme heat events, Climate Central said, the urban heat island effect can worsen heat-related illness for millions, put vulnerable populations at risk, and radiating back the sun's heat. Climate Central's research sought to pinpoint these impacts on a neighborhood scale, focusing on extreme heat index.

The heat island effect is hardly a novel concept. In research dating back to the 1940s, the effect of buildings, roads and sidewalks on ambient temperatures, sometimes drastically, is a longstanding concern.
